

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

II. *Observations of the Eclipse of the Moon, Octob. 10th. 1725. made at Bristol, by John Burroughs Esq; communicated in a Letter to Mr. Chelfden, Surgeon to St. Thomas's Hospital, F. R. S.*

THE cloudy Weather here prevented us from seeing the Beginning of the Eclipse, or of total Darkness; but I observed, pretty exactly, the first Appearance of Light, after the total Darkness, and the End of the Eclipse; and their respective Times are as follows, *viz.*

	h	m	s
Beginning of Light	7	31	20
End of the Eclipse	8	29	30
	} apparent Time.		

Some small Time before the renewal of true Light, there appeared a remarkable Brightness upon the Eastern Limb of the Moon, which I am not certain how to account for; at first I reasoned with my self in this Manner; That all the Light which the Moon has, during her total Immersion in the Shadow, is by Rays from the Sun, refracted through the Earth's Atmosphere, and consequently those Rays must be in greater Plenty, near the Edge of the Shadow, than near the Axis. But this does not fully answser the Phænomenon, because the Light I speak of, was not only upon the Moon itself, (on whose Eastern Limb there was a manifest increase of Light, as she approached the Edge of the Shadow) but it was also diffused about the Edge of the Moon, to a sensible

Distance, which I would certainly have measured, if I had had proper instruments. And if others, who are more skilled in these Affairs, have made the like Observation, I shall no longer doubt of the Moon's having an Atmosphere.

*Bristol, Feb. 19.*  
1725.

III. *Sceleton duorum Humanorum petrefactorum pars.* Ex Epistola Joh. Jac. Scheuczer, M. D. R. S. S. ad Dom. Hans Sloane, Baronettum, S. R. V. Pr.

**N**Osti, Vir Expertissime, ex hominum diluvio submersonum genere paucas superstites esse reliquias. Neque ego haec tenus in nimirum satis collectione plures habui quam binas dorsi vertebrae, atro-nitentis splendoris, petrefactas. Nunc autem, ἀγαθὸν τοῦχον Museolo meo illatum, lapidi fissili *Oeningen* immersum λεῖψαν, omni attentione dignissimum, in quo distincte cernere licet, non vagae imaginationis simulacra, sed capitis humani à quovis alio animantium genere distinctivi partes benè multas, reapse residuas, cranii ambitum, os frontis, ossa sincipitis, occipitis, orbitam oculi, baseos cerebri & medullæ oblongatae λεῖψαν, prominentiam interiorem ossis occipitalis, quæ cerebelli lobos separat, colli vertebrae numero 7, partim denudatas, partim lapideo cortice tectas, & est hæc veluti orthographica sectio posterioris capitis partis.

Sed
